

Git

⇒ version control system

Founder
↓
Linus Torvalds
↳ Linux OS

- 1) Install git in your laptop
- 2) git --version

1) git init → to ask git to track / manage your project.

1) git init → to ask you to "project"

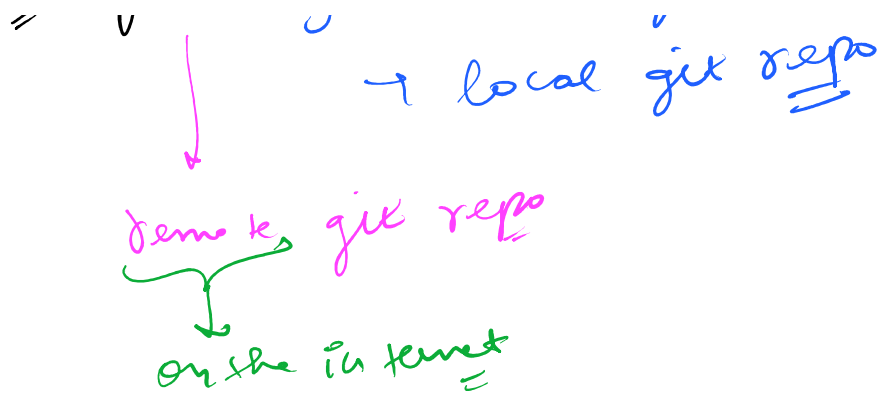

2) git status → tells you what all changes have been done from the prev version

→ git add → to move the changes to staging area

→ git commit -m "message" : permanently save all the changes in staging area

git hub } → local system
→ local git repo

~~connecting~~ pushing local project to git hub repo

- 1) Create a new repo on git hub
- 2) git remote add origin url.
- 3) git push origin branch name.

Creating a local copy of git hub project!

git clone link.

→ git pull . to get the changes from git hub to local copy

Branching

→ Branch
↳ copy of your code

- git check out -b "branch name"
- git check out "name"

For submitting Alex's assign

- 1) git add.
- 2) git commit -m "..."
- 3) git push origin main/master
